

## **PrismTech Acquires Xtradyne**

### ***Xtradyne's Security Solutions for Enterprise Networks Enhance PrismTech's Middleware Portfolio***

*Burlington, MA, USA – 02 November, 2004* –PrismTech, a leading provider of distributed and wireless software infrastructure, today announced the acquisition of Xtradyne Technologies (Xtradyne).

Founded in 1999 Xtradyne provides security solutions for applications based on industry standard middleware (CORBA, J2EE, Web Services and .NET). PrismTech had previously been distributing Xtradyne's products, which are complimentary to PrismTech's own product lines.

Xtradyne's security products are directly applicable to PrismTech's enterprise integration middleware solutions – allowing applications to run securely across firewalls and also make them available via the Internet without security risks. Furthermore the security skills and experience of Xtradyne's personnel will allow PrismTech to enhance its range of security solutions in the future.

Xtradyne products are currently used by Fortune 500 customers in the telecommunications, defense, finance, automotive and travel industries.

“PrismTech is excited by the opportunity presented by this acquisition, as security continues to grow in importance as more and more systems become integrated with public networks”, said Keith Steele, CEO, PrismTech. “PrismTech's leading position in enterprise integration middleware increasingly requires us to provide advanced security solutions as part of our product portfolio. This acquisition perfectly fills that gap and provides us with more skills and resources to provide security as a key component of our current and future solutions.”

“PrismTech's is a good fit for both our technology and our people” commented Sebastian Staamann Joint-CEO of Xtradyne. “It's a highly complementary fit giving us much wider

market access for our products and services”.

The flagship Xtradyne product is the Domain Boundary Controller (DBC), which eliminates the risks associated with the deployment of CORBA- and EJB-based applications over the Internet or other networks outside the firewall. The DBC acts as a security gateway that can be integrated transparently into existing systems without any modification to the existing software. DBC is also available for Web Services-based applications providing enterprises with protection against malformed messages and malicious content: at the company’s domain boundary, while in transit by means of encryption, and for Authentication, Authorization and Audit.
